Major Current Projects

Name Omitted: The focus of this project expands on our prior work with NetSense / NetHealth (see below) to explore how smartphones and wearable devices can be used to capture and model workplace productivity via tremendously complex systems at play. The effort is a three and a half year work funded by a major funding agency with myself serving as the lead PI and Notre Dame as the lead institution (est. $16.1M). Six contributing institutions also are part of the effort (UC-Irvine, Georgia Tech, Dartmouth, Carnegie Mellon, Indiana, Colorado-Boulder). The work is slated to begin in May / June 2017.

NetSense Smartphone Study: The NetSense smartphone study has instrumented nearly two hundred incoming freshmen at the University of Notre Dame for the purposes of exploring the interplay between smartphone usage (always-on networking) and social ties (make / keep friends). The study has now been gathering data since August of 2011 and is slated to run through May of 2015. My particular focus for this work is with respect to the instrumentation on the device itself (data backend, data security) as well as exploring network usage patterns / optimization efforts. Our current research efforts are focusing on indoor optimization, WiFi offloading, and streamlined content distribution in ultra-dense environments (ex. stadium, dining hall, classroom).

NetHealth Study: The NetHealth study expands upon the NetSense study to instrument 500 incoming freshmen in the fall of 2015 with smartphone agents, health sensors (ex. Fitbit Surge, Basis Peak), and co-location sensing (Bluetooth LE). The focus of the work from a sociological perspective is to explore the underlying network effects with regards to homophily on quantitative metrics such as physical activity levels and sleep. The study will instrument 500 students with rich sensing capabilities with an additional 500+ students carrying lightweight smartphone agents and co-location beacons.

WeHab: The WeHab study explores how low-cost motion-based gaming peripherals (ex. Nintendo Wii Balance Board, Microsoft Kinect) can be used to deliver enhanced balance rehabilitation with applications for post-TBI (stroke, concussion) and orthopedic physical therapy. Our current research efforts are focusing on robust framework development (open source instrumentation platform), audio feedback mechanisms, and predictive modeling for mapping in-therapy results to existing evaluation mechanisms (Berg Balance, FIM).
