## VI. TECHNICAL PUBLICATIONS AND PRESENTATIONS

Most publications are available via IEEE Xplore or the ACM Digital Library.

### Major Current Projects

Tesserae: The focus of this project expands on our prior work with NetSense / NetHealth (see below) to explore how smartphones, wearable devices, social media, and context can be used to capture and model workplace productivity. The work has instrumented seven hundred and fifty working professionals in cognitively demanding professions (information work) and instrumented their day to day activities over a period of one year. I am serving as the lead PI with Notre Dame as the lead institution (approx. \$10M in total). Eight contributing institutions have been part of the effort (University of California-Irvine, Georgia Tech, Dartmouth, Carnegie Mellon, University of Colorado-Boulder, Ohio State, University of Texas-Austin, University of Washington). The work began in June 2017 and will run through December 2020.

Fast Mobile Network Characterization: The goal of the Fast Mobile Network Characterization (FMNC) work is to explore how cleverly constructed packet probing trains can be created to accurately, rapidly, and efficiently capture the link characteristics for various types of wireless links (WiFi, LTE). Current work includes explorations of active and passive approaches to link characterization.

### Past Major Projects

NetSense Smartphone Study: The NetSense smartphone study has instrumented nearly two hundred incoming freshmen at the University of Notre Dame for the purposes of exploring the interplay between smartphone usage (always-on networking) and social ties (make / keep friends). The study has now been gathering data since August of 2011 and is slated to run through May of 2015. My particular focus for this work is with respect to the instrumentation on the device itself (data backend, data security) as well as exploring network usage patterns / optimization efforts. Our current research efforts are focusing on indoor optimization, WiFi offloading, and streamlined content distribution in ultra-dense environments (ex. stadium, dining hall, classroom).

NetHealth Study: The NetHealth study expanded upon the NetSense study to instrument 500 incoming freshmen in the Fall of 2015 with smartphone agents, health sensors (Fitbit Charge HR), and co-location sensing (shared locations). The focus of the work from a sociological perspective was to explore the underlying network effects with regards to homophily on quantitative metrics such as physical activity levels and sleep. The study instrumented over 700 students with rich sensing capabilities and gathered data for students from their freshmen through senior years.

WeHab: The WeHab study explores how low-cost motion-based gaming peripherals (ex. Nintendo Wii Balance Board, Microsoft Kinect) can be used to deliver enhanced balance rehabilitation with applications for post-TBI (stroke, concussion) and orthopedic physical therapy. Our current research efforts are focusing on robust framework development (open source instrumentation platform), audio feedback mechanisms, and predictive modeling for mapping in-therapy results to existing evaluation mechanisms (Berg Balance, FIM).
