

# Phone Photography 101: How to Take Good Pictures With Your Phone

[blog.hubspot.com/marketing/good-pictures-phone-tips](https://blog.hubspot.com/marketing/good-pictures-phone-tips)

## 1) Use gridlines to balance your shot.

One of the easiest and best ways to improve your mobile photos is to turn on the camera's gridlines. That superimposes a series of lines on the screen of your smartphone's camera that are based on the "[rule of thirds](#)" -- a photographic composition principle that says an image should be broken down into thirds, both horizontally and vertically, so you have nine parts in total.

According to this theory, if you place points of interest in these intersections or along the lines, your photo will be more balanced, level, and allow viewers to interact with it more naturally.

Source: [Digital Photography School](#)

To switch the grid on ...

- **iPhone:** Go to "Settings," choose "Photos & Camera," and switch "Grid" on.
- **Samsung Galaxy:** Launch the camera app, go to "Settings," scroll down and switch the "grid lines" option to "on."

## 2) Focus on one subject.

Many of the best photos include just one, interesting subject. So when taking a picture of one, spend some extra time setting up the shot. Some professional photographers say that the subject [shouldn't fill the entire frame, and that two-thirds of the photo should be negative space](#) -- that helps the subject stand out even more.

But be sure you tap the screen of your smartphone to focus the camera on your subject -- that'll help to ensure that

it's focused and the lighting is optimized.

**Pro Tip:** Once you've taken your photo, you can use filters and apps to make the subject even more vivid, or to crop it to frame the subject correctly. The brightness, contrast, and saturation of the photo can also be adjusted accordingly -- all from your phone.

### 3) Embrace negative space.

"Negative space" simply refers to the areas around and between the subjects of an image --and it can take a photo from "good" to "great."

When you include a lot of empty space in a photo, your subject will stand out more and evoke a stronger reaction from your viewer. And what does negative space look like? It's often a large expanse of open sky, water, an empty field, or a large wall, as in the examples below.

### 4) Find different perspectives.

Taking photos from a unique, unexpected angle can make them more memorable -- it tends to create an illusion of depth or height with the subjects. It also makes the image stand out, since most mobile photos are taken either straight-on or from a bird's eye view.

Try taking a photo directly upward and playing with the sky as negative space, like in the first photo below. Or, you can try taking it at a slight downward angle.

**Pro Tip:** If you take a photo and find the perspective is a little askew or tilted, use the [SKRWT photo editing app](#) to make the lines look clean and square.

### 5) Play with reflections.

There's something so idyllic about seeing the sky reflected in a body of water. There's a reason why we love seeing that -- our eyes are drawn to reflections. So look for opportunities to play with them in photos.

There are plenty of out-of-the-box places to find reflections -- puddles, larger bodies of water, mirrors, sunglasses, drinking glasses, and metallic surfaces are just a few.

### 6) Use leading lines.

In some photos, there's a line that draws the viewer's eye toward a certain part of the frame. Those are called leading lines. They can be straight or curvilinear -- think staircases, building facades, train tracks, roads, or even a path through the woods.

Leading lines are great for creating a sense of depth in an image, and can make your photo look purposefully designed -- even if you just happened to come upon a really cool shape by accident.

### 7) Look for symmetry.

Symmetry can be [defined](#) as "a vague sense of harmonious and beautiful proportion and balance." And pictures that contain symmetry can be incredibly pleasing to the eye -- it's also one of the simplest and most compelling ways to compose a photo.

In photography, [symmetry usually means](#) creating an image that can be divided into two equal parts that are mirror images of each other. That's a bit different than reflections -- symmetry can be found "in the wild," as per the staircase picture, or you can set up your photo accordingly, like photographer Eric Christian did in the first photo

below.

And remember -- use those gridlines from tip #1 to line everything up perfectly.

## 8) Keep an eye out for repetitive patterns.

Repetitive patterns are very pleasing to the eye -- they appear whenever strong graphic elements are repeated over and over again, like lines, geometric shapes, forms, and colors. These patterns can make a strong visual impact, and photographing something like a beautiful, tiled floor can be enough to create a striking image. Other times, it's more fun to keep an eye out for where they appear naturally or unintentionally, like with the congruent fire escapes on the left.

## 9) Mess around with color blocking.

Isn't it cool when an entire photo is black and white, except for a single object? It turns out that yes, indeed, there are apps for that. One of our favorites is [Touch Color](#) -- an app that automatically converts a picture to grayscale and lets you fill in the parts you want to colorize.

Color blocking can help to highlight the elements of a photo that you want to stand out, like a plant or something else with a bold hue. It achieves a similar goal as negative space, in that it can help a single subject stand out -- but with color blocking, the photo's other elements remain intact for a cohesive image.

## 10) Avoid zooming in.

When you take a photo from a distance, it's tempting to zoom in on something specific you're trying to capture. But it's actually better *not* to zoom in -- doing so can make the photo appear grainy, blurry, or pixelated.

Instead, try to get closer to your subject -- unless it's a wild animal, in which case we would advise keeping your distance -- or take the photo from a default distance, and crop it later on. That way, you won't compromise quality, and it's easier to play around or optimize a larger image.

## 11) Capture small details.

You may have heard the phrase, "It's the little things." Sometimes, that also applies to photos. Close-up images that

capture small, intricate, and delicate details can make for really compelling visual content. Keep an eye out for textures and patterns like peeling paint, a gravel road, or a tile tabletop.

**Pro Tip:** Use the "sharpen" tool [in your favorite photo editing app](#) to (conservatively) sharpen the details of your photo. You might also download the Camera+ app and use its Clarity filter, which is what *The Wall Street Journal's* [Kevin Sintumuang](#) calls the app's "secret sauce -- it adds pro-camera crispness to almost any shot."

## 12) Use natural light.

Let's face it: You'd be hard-pressed to find a great smartphone photo that was taken with a flash. Most of the time, they make a photo look overexposed, negatively altering colors and making human subjects look washed out. In fact, even the iPhone 7's flash is [rumored to have some flaws](#).

So instead of using flash, take advantage of the sources of natural light you can find, even after dark. That gives you a chance to play with shadows, like in the second image below, or create a silhouette with other ambient sources of light, like traffic and surrounding buildings.

Once you've taken the photo, play with the "Exposure" tool [in your favorite photo editing app](#) to see if you can make the image slightly brighter, without making it too grainy.

## 13) Create abstracts.

Abstract photos are meant to capture the essence of an object, or a series of them, without revealing the entire landscape as a whole. In other words, they serve the purpose of creating unique, surprising images from ordinary subjects.

This look can be accomplished by cropping an abstract portion of an otherwise normal photo, or by taking close-up shots of objects that leave the viewer wondering -- in admiration, of course -- what the subject might be. And subjects with patterns or repetition are great candidates for abstract photography, like in the photo of sliced figs below.

## 14) Take candid.

Posed photos can be great for the sake of memories -- happy moments with friends, family, or the occasional run-in with a celebrity. But sometimes, candid shots of people doing things, or people with people, can be far more interesting.

That's because candid photos are better able to effectively capture the emotion and essence of a moment. One of the best ways to capture this kind of shot is to just take as many photos as possible. You'll have more to choose from, and the best photos often happen when the "stars align," so to speak, in a single moment -- everyone's eyes are open, one person is tilting their head just so, and you finally got a shot of your chronically closed-lip friend smiling with his teeth.

## 15) Be non-conventional.

Composition is a huge part of what makes a photo great, but so is the photo's subject. Some of the most delightful and remarkable photos come out of cool, unique ideas. [Images are more effective than text at evoking emotion](#) from your viewers -- that often means getting your photos to say something.

Try thinking outside of the box when it comes to what you're capturing -- your viewers could be pleasantly surprised by a cool or unexpected subject.

## 16) Make 'em laugh.

Speaking of evoking emotion, sometimes the most memorable photos are the ones that make us giggle. The image below of an older woman wearing a brightly-colored shirt stating "Hi hater" is funny because it's unexpected -- and there's a part of us that admires her, too. The second image of the dog toy on a dinner plate pokes fun at classic Instagram food shots, but it's from a dog's perspective. If you can make your audience laugh, they're likely to enjoy your photo.

## 17) Attach an external lens.

Want to get really fancy? External lenses are for you. There are actually several out there that can be attached to the top of your smartphone's native camera lens -- from fish-eye to wide-angle lenses, these add-ons can bring an entirely new quality and perspective to your photos.

According to [Wirecutter](#), the best camera lenses for iPhone photography are made by [Moment](#), a manufacturer of mobile lenses. Start there, or do some research to find the lens add-ons that fit your smartphone photography needs.

## 18) Don't afraid to edit.

Composing and taking your smartphone photo is just the first step to making it visually compelling. Editing your photos is the next step -- and a very critical one, at that. Filters can be a valuable photographic tool, particularly when it comes to two goals: 1) Removing blemishes from a picture, and 2) making food look even more delicious.

For the first, *InStyle* magazine compiled a fun list of "[The Best Instagram Filters for Every Beauty Complaint](#)" -- and now, the [iPhone photos app](#) offers many similar filters. There are also apps like [Pho.to](#), which can automatically retouch facial photos without a lot of work. And when it comes to those photos of your daily meals? One of the latest apps available is [Foodie](#), which comes with its own set of filters optimized for different types of food.

But there are many other great photo and video editing apps out there for mobile devices -- check out [this post](#) to see some of the best ones out there.
