

Thoughts on HW #9

- Start early!
- Start early!
- The power of the group.
 - Read the whole homework before you start anything.
 - Ask for clarifications.
 - Walk through and come up with a plan.
 - Review documentation together.
 - Start together (For example, get one development environment working, then replicate).
- **USE** office hours.
- Installation was a pain (I felt it too, kinda).
 - Know who you are.
 - Know when to use root and when not to.
 - Don't run 'similar' commands as both root and non-root user.
 - Be consistent.
 - Know where you are.
 - Remember to activate virtual environment.
 - Production or Development environment.
 - /opt or /home/username
 - Understand what you are doing.
 - Don't just copy/paste commands.
 - Use the right version.
 - Remember: LTS, Stable.
 - Remember: This is a STACK, and not a framework.
 - Lots of dependencies.
 - Lots of documentations.
- If you have a question about an error:
 - State the context of the error.
 - Make sure to post the 'full' error when asking for help.
- Start simple (demo)
 - Add one field at a time to get used to how things work.
- Make sure VM has enough resources.
- Use IDEs.
 - Lots of things here.
- A little pressure is good for you!
- Start early!
